

Package ‘vimr’

March 26, 2019

Title vimr -- Vaccine Impact Model

Version 0.0.1

Author Modelling and Economic Evaluation of Vaccines group, LSHTM (<http://meev.lshtm.ac.uk/>)

Description 'vimr' is a vaccine impact model (R package) for estimating the health impact of vaccination programmes at the national level for a given set of countries. This R package is based of the spreadsheet-based tool (UNIVAC) which is a universal framework for evaluating vaccine policy options in low- and middle-income countries, and is accessible at <https://www.paho.org/provac-toolkit/>.

Depends R (>= 3.4.3)

<code>data.agespecificfert</code>	<i>Age-specific fertility rate</i>
-----------------------------------	------------------------------------

Description

Dataset containing age-specific fertility rate by country, age range, year and gender

Usage

```
data.agespecificfert
```

Format

A data frame with 20580 observations on the following 8 variables.

country_code_numeric a numeric vector

country_code country code

country name of country

age_from starting age

age_to end age

year year

gender gender

value fertility rate

Source

Demographic data from the Vaccine Impact Modelling Consortium (VIMC)

data.births	<i>Number of Births</i>
-------------	-------------------------

Description

Dataset containing number of births by country, age range, year and gender

Usage

```
data.births
```

Format

A data frame with 14700 observations on the following 8 variables.

country_code_numeric a numeric vector

country_code country code

country name of country

age_from starting age

age_to end age

year year

gender gender

value number of births

Source

Demographic data from the Vaccine Impact Modelling Consortium (VIMC)

data.birthsbymaternalage	<i>Number of births by age of mother</i>
--------------------------	--

Description

Dataset with the number of births by maternal by country, year and gender

Usage

```
data.birthsbymaternalage
```

Format

A data frame with 20580 observations on the following 8 variables.

country_code_numeric a numeric vector

country_code country code

country name of country

age_from starting age

age_to end age

year year

gender gender

value number of births

Source

Demographic data from the Vaccine Impact Modelling Consortium (VIMC)

data.birthsquinquennial

Number of births - quinquennial

Description

Dataset containing number of births occurring every 5 years by country, age range, year and gender

Usage

```
data.birthsquinquennial
```

Format

A data frame with 2940 observations on the following 8 variables.

country_code_numeric a numeric vector

country_code country code

country name of country

age_from starting age

age_to end age

year year

gender gender

value number of births occurring every 5 years

Source

Demographic data from the Vaccine Impact Modelling Consortium (VIMC)

data.centraldeathrateASMR	<i>Central death rate</i>
---------------------------	---------------------------

Description

Dataset containing central death rate by country, age range, year and gender

Usage

```
data.centraldeathrateASMR
```

Format

A data frame with 55860 observations on the following 8 variables.

country_code_numeric a numeric vector

country_code country code

country name of country

age_from starting age

age_to end age

year year

gender gender

value central death rate

Source

Demographic data from the Vaccine Impact Modelling Consortium (VIMC)

data.crudebirthrate	<i>Crude birth rate (CBR)</i>
---------------------	-------------------------------

Description

Dataset containing crude birth rate by country, age range, year and gender

Usage

```
data.crudebirthrate
```

Format

A data frame with 14700 observations on the following 8 variables.

country_code_numeric a numeric vector

country_code country code

country name of country

age_from starting age

age_to end age

year year

gender gender

value crude birth rate

Source

Demographic data from the Vaccine Impact Modelling Consortium (VIMC)

data.crudeddeathrate	<i>Crude death rate</i>
----------------------	-------------------------

Description

Dataset containing crude death rate (CDR) by country, age range, year and gender

Usage

```
data.crudeddeathrate
```

Format

A data frame with 14700 observations on the following 8 variables.

country_code_numeric a numeric vector

country_code country code

country name of country

age_from starting age

age_to end age

year year

gender gender

value crude death rate

Source

Demographic data from the Vaccine Impact Modelling Consortium (VIMC)

data.deathsbyage	<i>Number of deaths by age</i>
------------------	--------------------------------

Description

Dataset containing number of deaths by country, age range, year and gender

Usage

```
data.deathsbyage
```

Format

A data frame with 58800 observations on the following 8 variables.

country_code_numeric a numeric vector

country_code country code

country name of country

age_from starting age

age_to end age

year year

gender gender

value number of deaths

Source

Demographic data from the Vaccine Impact Modelling Consortium (VIMC)

data.growthrate	<i>Growth rate</i>
-----------------	--------------------

Description

Dataset containing growth rate by country, age range, year and gender

Usage

```
data.growthrate
```

Format

A data frame with 2940 observations on the following 8 variables.

country_code_numeric a numeric vector

country_code country code

country name of country

age_from starting age

age_to end age

year year

gender gender

value growth rate

Source

Demographic data from the Vaccine Impact Modelling Consortium (VIMC)

data.Hib_DALY	<i>Disability weights for Haemophilus influenzae type B</i>
---------------	---

Description

Dataset disability weights for Haemophilus influenzae type B by condition/sequelae

Usage

data.Hib_DALY

Format

A data frame with 24 observations on the following 3 variables.

Disease disease

Condition condition/sequelae

GBD_2015_mean Mean disability weight

Source

General Guidance for DALYs calculation VIMC with input from DOVE 2017-11-24 11:03:46

data.Hib_Hibmeningitissequalae_cases	<i>Event rates (cases) for Haemophilus influenzae type b (Hib): Hib meningitis sequelae</i>
--------------------------------------	---

data.pdeathbyage	<i>Probability of dying by age</i>
------------------	------------------------------------

Description

Dataset containing probability of dying by age by country, age range, year and gender

Usage

```
data.pdeathbyage
```

Format

A data frame with 52920 observations on the following 8 variables.

country_code_numeric a numeric vector

country_code country code

country name of country

age_from starting age

age_to end age

year year

gender gender

value probability of dying

Source

Demographic data from the Vaccine Impact Modelling Consortium (VIMC)

data.quinquennialpop	<i>Quinquennial population (5-year time and age)</i>
----------------------	--

Description

Dataset containing population - quinquennial population (5-year time and age) by country, age range, year and gender

Usage

```
data.quinquennialpop
```

Format

A data frame with 71442 observations on the following 8 variables.

country_code_numeric a numeric vector
country_code country code
country name of country
age_from starting age
age_to end age
year year
gender gender
value population quinquennial 5-year time and age

Source

Source

Bilcke J. et al. Estimating the Incidence of Symptomatic Rotavirus Infections: A Systematic Review and Meta-Analysis. PLOS One, June 2009, Volume 4, Issue 6, e6060. Note: random effects model resulted in a global incidence estimate of 0.24 [0.17; 0.34] symptomatic RV infections per person year of observation for children below 2 years of age. Crudely extrapolating to children aged <5yrs, and assuming minimal incidence aged 2+yrs, gives an under-five incidence rate of 0.10 [0.07 - 0.14] or 10,000 [7,000 - 14,000] per 100,000 per year <5yrs. Severe incidence rates derived from Fischer-Walker (see source for severe RVGE incidence), were then subtracted to give non-severe RVGE incidence.

`data.rotavirus_nonsevere_RVGE_visits`*Event rates (visits) for Rotavirus non-severe RVGE*

Description

Dataset containing event rates (visits) for rotavirus D1 for non-severe RVGE

Usage`data.rotavirus_nonsevere_RVGE_visits`

Demographic data from the Vaccine Impact Modelling Consortium (VIMC)

data.totalfert	<i>Total fertility rate</i>
----------------	-----------------------------

Description

Dataset containing total fertility rate by country, age range, year and gender

Usage

```
data.totalfert
```

Format

A data frame with 14700 observations on the following 8 variables.

country_code_numeric a numeric vector

country_code country code

country name of country

age_from starting age

age_to end age

year year

gender gender

value total fertility rate

Source

Demographic data from the Vaccine Impact Modelling Consortium (VIMC)

data.totalpop	<i>Total population</i>
---------------	-------------------------

Description

Dataset containing total population country, age range, year and gender

Usage

```
data.totalpop
```

Format

A data frame with 14798 observations on the following 8 variables.

country_code_numeric a numeric vector

country_code country code

country name of country

age_from starting age

age_to end age

year year

gender gender

value total population

Source

Demographic data from the Vaccine Impact Modelling Consortium (VIMC)

data.u1mortality	<i>Under 1 mortality rate</i>
------------------	-------------------------------

Description

Dataset containing under 1 mortality rate by country, age range, year and gender

Usage

```
data.u1mortality
```

Format

A data frame with 14700 observations on the following 8 variables.

country_code_numeric a numeric vector

country_code country code

country name of country

age_from starting age

age_to end age

year year

gender gender

value under 1 mortality rate

Source

Demographic data from the Vaccine Impact Modelling Consortium (VIMC)

data.u5mortality	<i>Under 5 mortality rate</i>
------------------	-------------------------------

Description

Dataset containing under 5 mortality rate by country, age range, year and gender

Usage

```
data.u5mortality
```

Format

A data frame with 20580 observations on the following 8 variables.

country_code_numeric a numeric vector

country_code country code

country name of country

age_from starting age

age_to end age

year year

gender gender

vimr	<i>vimr: Vaccine Impact Model</i>
------	-----------------------------------

Description

"vimr" is a vaccine impact model (R package) for estimating the health impact of vaccination programmes at the national level for a given set of countries. This R package is based of the spreadsheet-based tool (UNIVAC) which is a universal framework for evaluating vaccine policy options in low- and middle-income countries, and is accessible at <https://www.paho.org/provac-toolkit/>,

Vaccine impact model

Estimate the health impact of vaccination at the national level.

Hib, pneumococcal and rotavirus vaccination can be separately analysed.

Multiple countries can be analysed and results are generated for each country.

writelog	<i>Simulation log reporting</i>
----------	---------------------------------

Description

Appends message of simulation run (x) to log file (logname).

Usage

```
writelog(logname, x)
```

Arguments

logname	log filename
x	message of simulation run

Value

None

Examples

```
#
```
